Number of Tracked Objects in Orbit, 1957-2024

Amanda Montañez; Source: "Satellite Statistics: Satellite and Debris Population," Jonathan's Space Report (data)

- There is a land rush happening right over our heads in space – by private companies
- Almost 10,000 ‘active’ satellites in orbit right now, up from 6,500 only three years ago.
- The nearly 6,000 Starlink satellites launched by Elon Musk’s SpaceX now make up more than half of the total, and they are part of a planned fleet of up to 42,000.

- There is a land rush happening right over our heads in space – by private companies
- Almost 10,000 ‘active’ satellites in orbit right now, up from 6,500 only three years ago.
- The nearly 6,000 Starlink satellites launched by Elon Musk’s SpaceX now make up more than half of the total, and they are part of a planned fleet of up to 42,000.
- Starlink is only the first of 21 planned ‘mega-constellations’ underway
- 555,127 planned satellites (see - Jonathan McDowell, <https://planet4589.org>)

Let's Meet the 'Easy' Amateur Radio Satellites

- Orbiting in 'LEO' – Low Earth Orbit
- Accessible with an FM dual band radio (vhf/uhf)
HT / mobile / base station

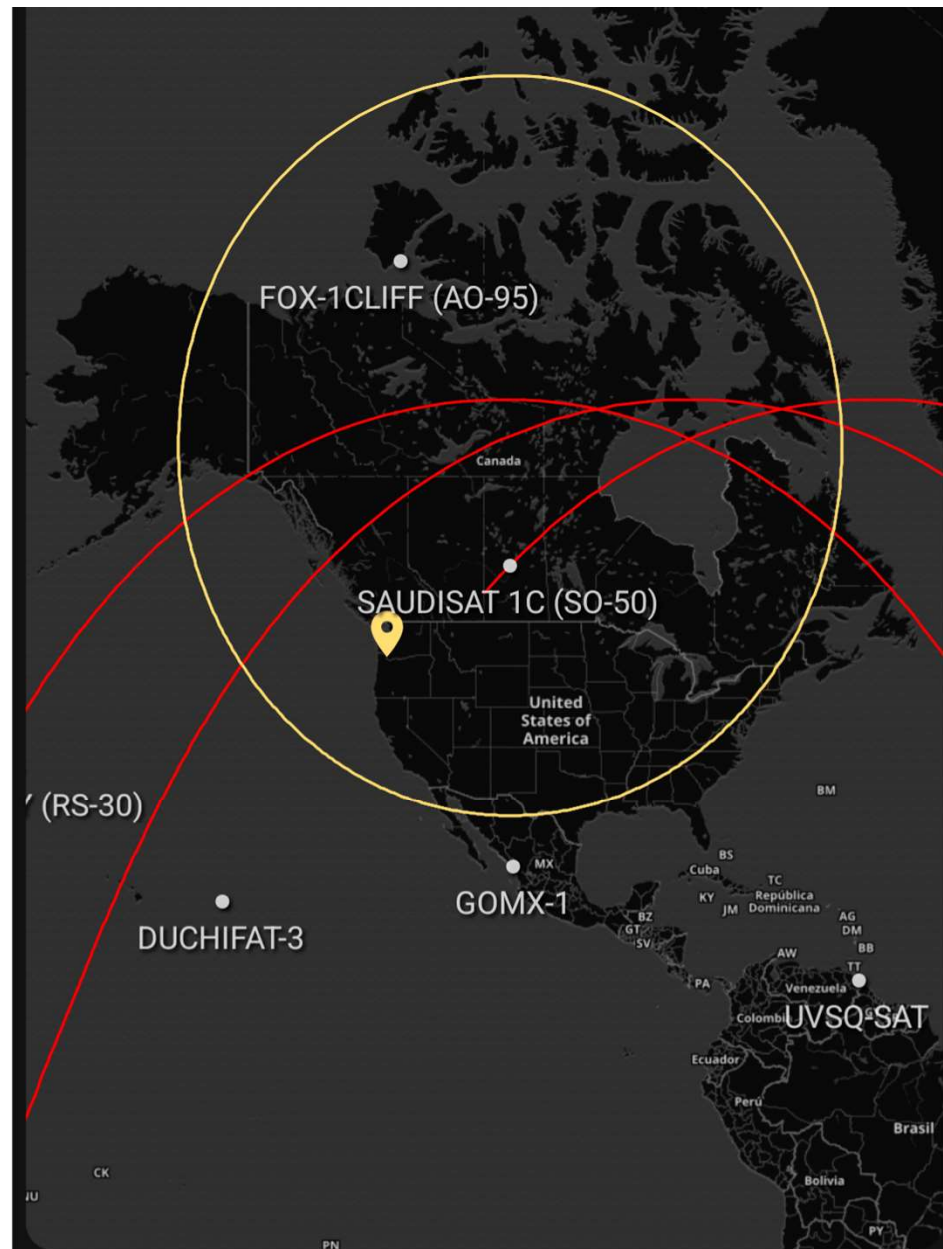

SO-50 (Saudi-OSCAR 50)

Dimensions: 25cm Cube
Downlink power: 250 mW

2002

Period: 97 min

Azimuth: 46.4°

Altitude: 617 km

Latitude: 53.6°

QTH Locator: D063sn

Phase: 42.5°

Elevation: 15.1°

Distance: 1658 km

Longitude: -106.4°

Velocity: 7.56 km/s

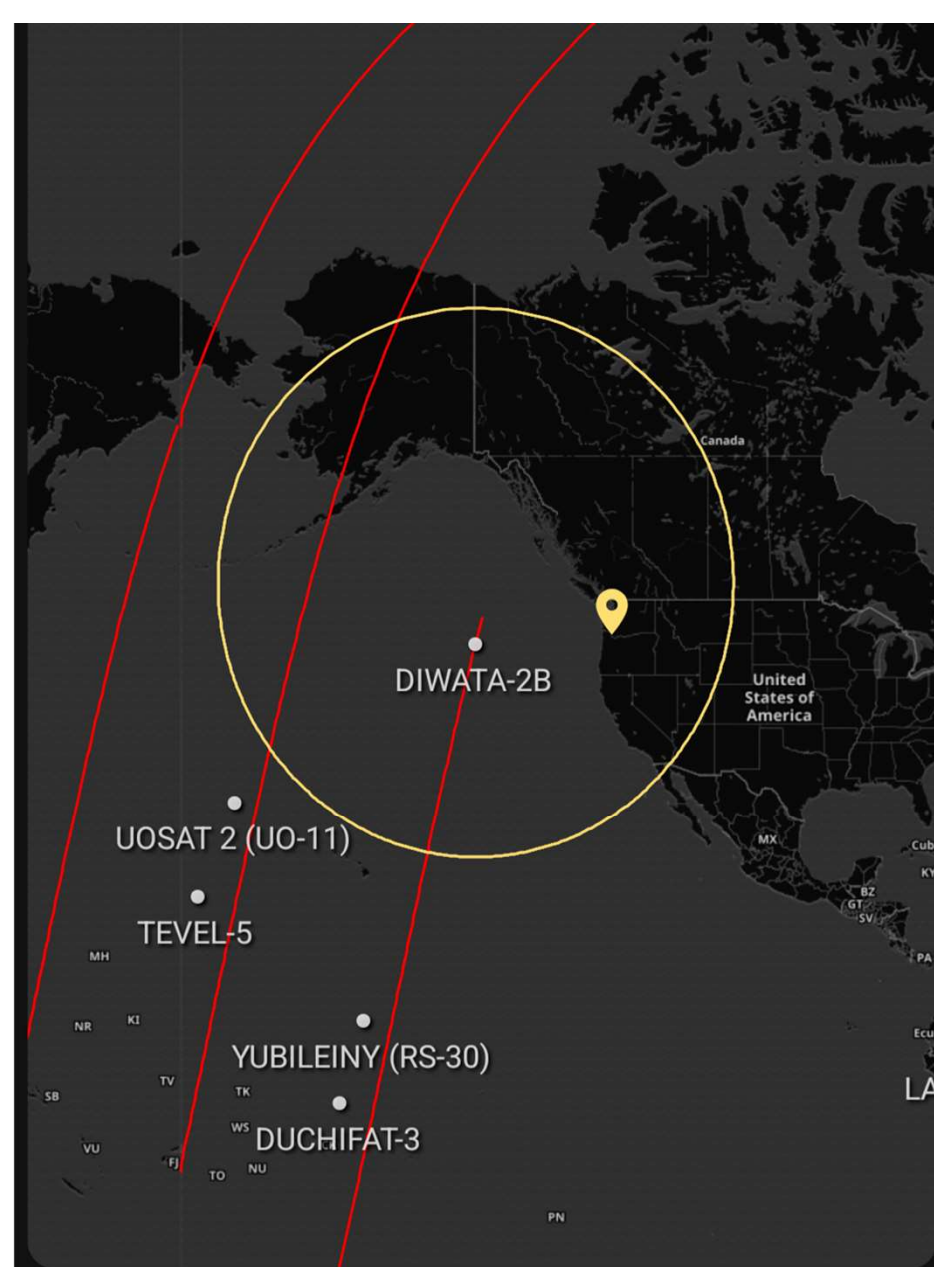

PO-101 (Philippines-OSCAR 101)

AKA: DIWATA-2B

Dimensions: 50cm Cube

2018

Period: 96 min

Azimuth: 274.4°

Altitude: 576 km

Latitude: 45.0°

QTH Locator: BN94ox

Phase: 8.1°

Elevation: 14.6°

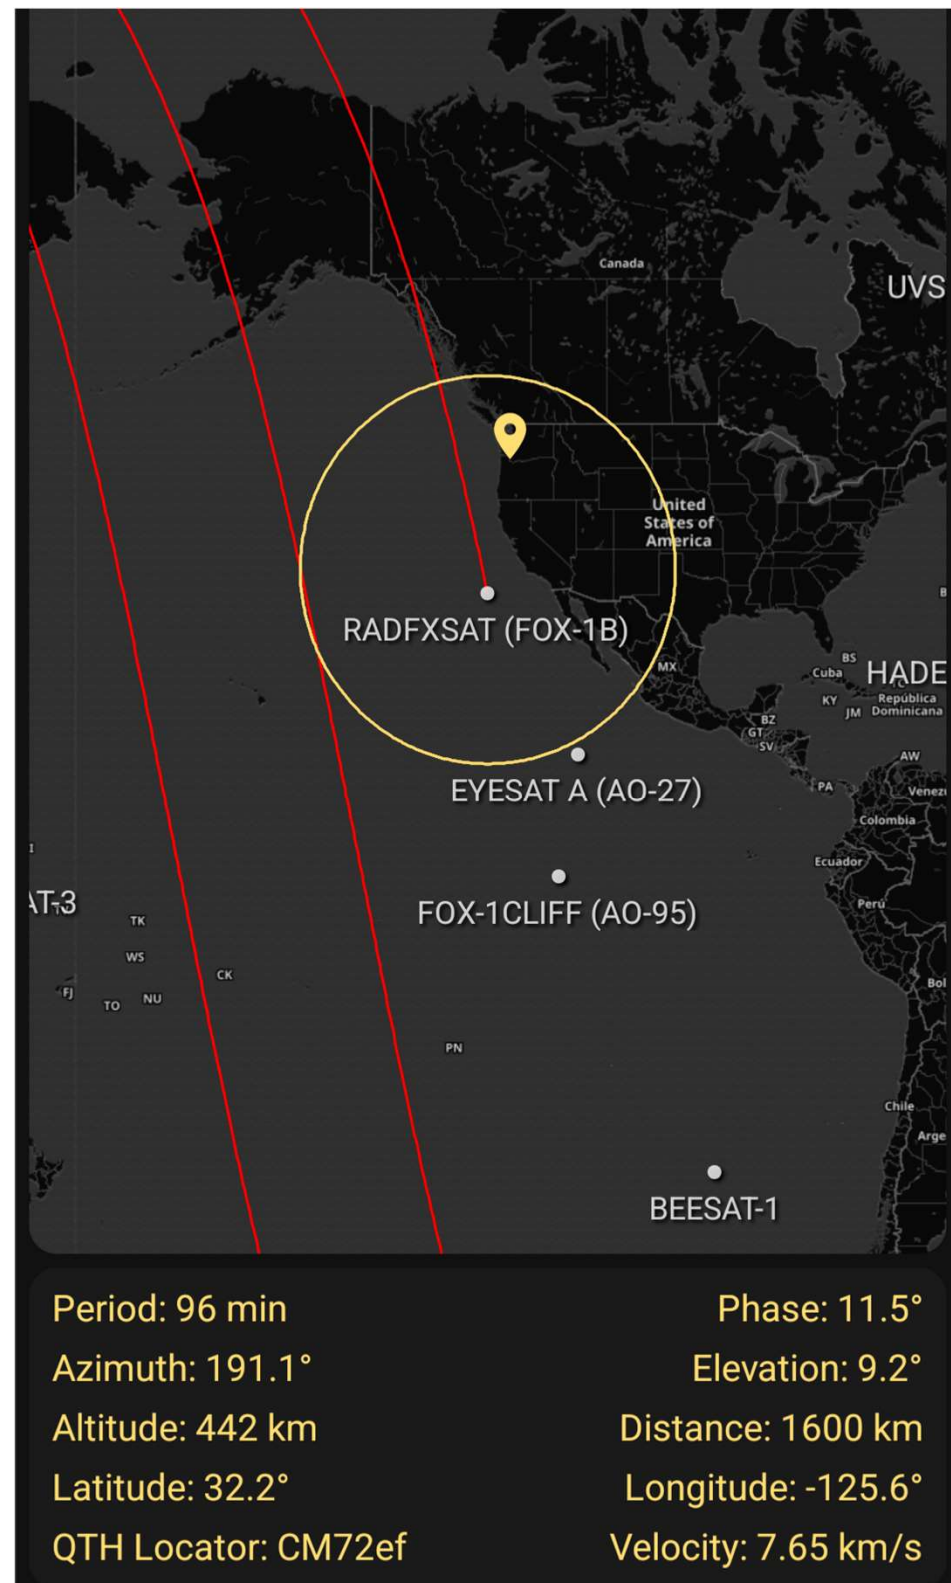

Distance: 1595 km

Longitude: -140.8°

Velocity: 7.58 km/s

AO-91 (AMSAT OSCAR 91)

Dimensions: 1U CubeSat
Downlink power: 500 mW

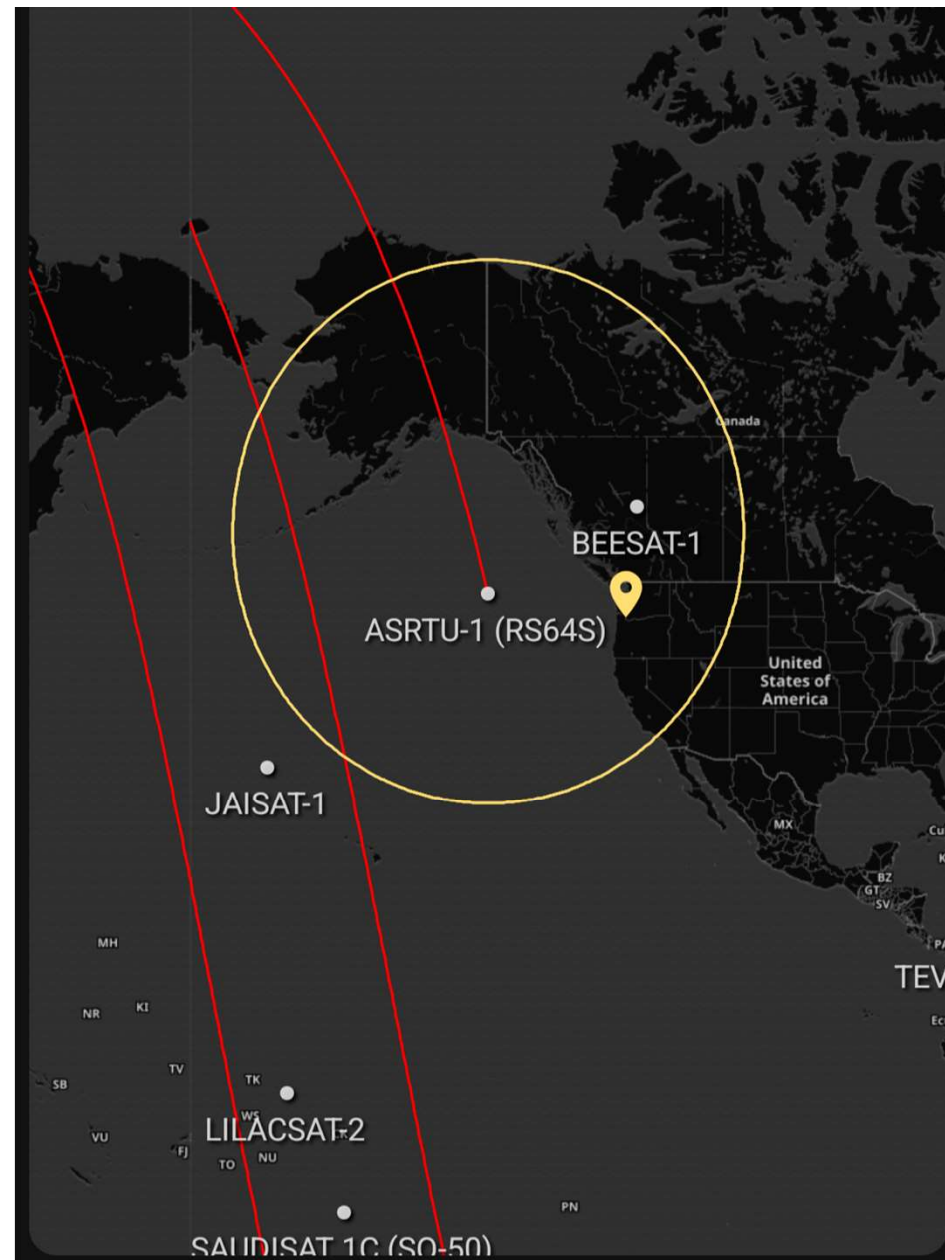

AO-123(ASRTU OSCAR 123)

Dimensions: 12U CubeSat

2024

Period: 94 min

Phase: 333.6°

Azimuth: 288.0°

Elevation: 12.0°

Altitude: 489 km

Distance: 1547 km

Latitude: 48.0°

Longitude: -140.8°

QTH Locator: BN97ox

Velocity: 7.63 km/s

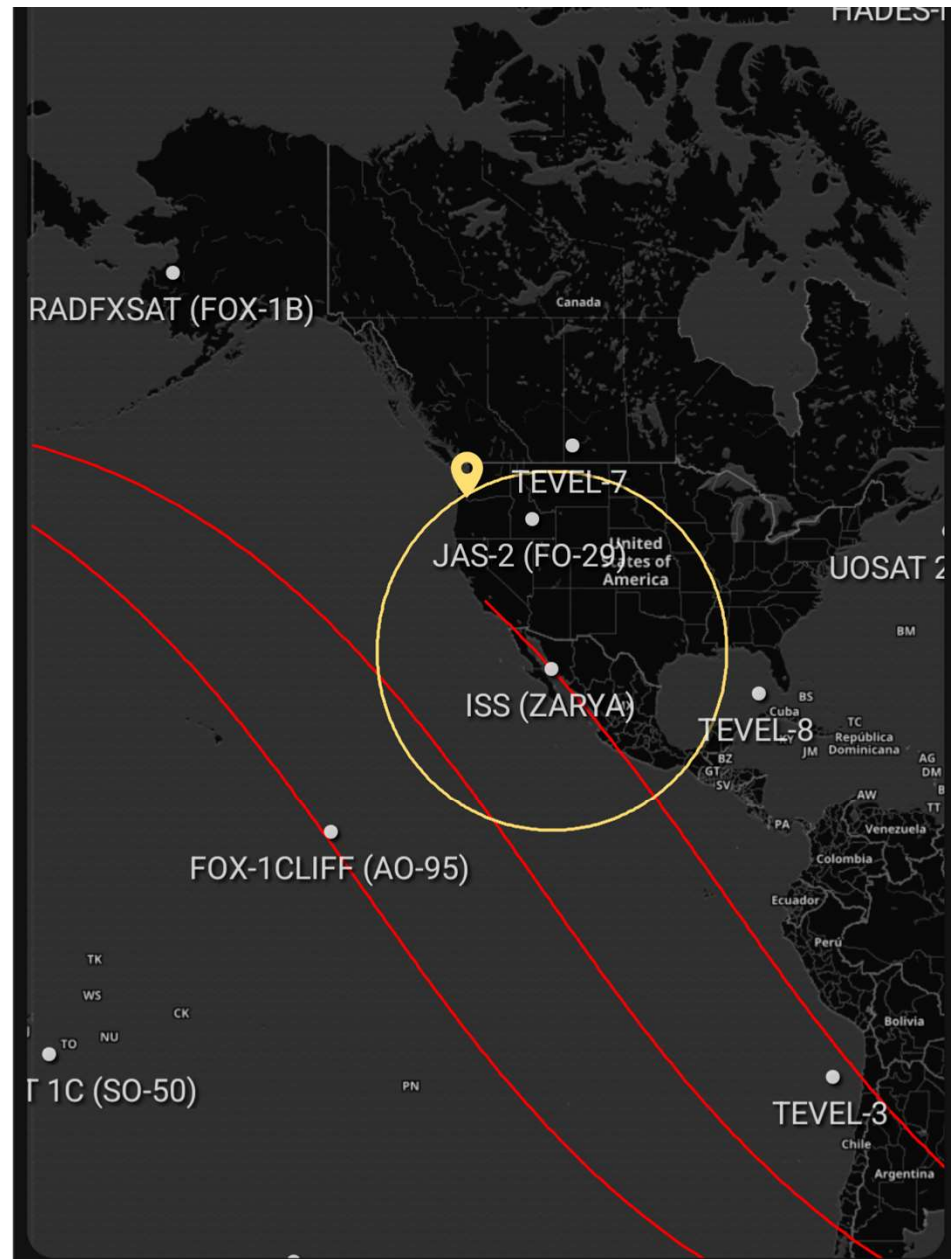

ARISS (Amateur Radio on the ISS)

Dimensions: 356 feet (109 meters) end-to-end, one yard shy of the full length of an American football field including the end zones

Downlink power: 5 W

2030 Retirement

Period: 93 min

Azimuth: 149.3°

Altitude: 419 km

Latitude: 28.0°

QTH Locator: DL47gx

Phase: 136.0°

Elevation: 0.7°

Distance: 2271 km

Longitude: -111.4°

Velocity: 7.67 km/s

New FM Satellites Coming in 2025

CAS-11

- 6U CubeSat
- Estimate 250mW downlink

HADES-ICM & HADES-R

- 1.5p PocketQubes
- 250 mW downlink

**Launching
January 14th!!**

How do I find the satellites?

- Predicting satellite positions and passes for up to a week
- Showing the list of currently active and upcoming satellite passes
- Showing the active pass progress, polar trajectory and transceivers info
- Showing the satellite positional data, footprint and ground track on a map
- Custom TLE data import is available via files with TXT or TLE extensions
- Offline first: calculations are made offline. Weekly update of TLE data is recommended.

- Track dozens of ham and weather satellites. Includes transmitter frequencies and Doppler shift calculations.
- Overview of the coming passes
- Weather conditions for perfect sightings
- Notifications and Alarms

- See what's in the sky above you right now or at a given moment
- Get precise predictions for passes of the International Space Station (ISS) and most visible satellites
- Get passes for amateur radio satellites, complete with uplink and downlink information
- Predictions are generated right on your phone so you only need a data connection every few days.

b - Activated by schedule - see <https://x.com/Diwata2PH>

c - Has a 10 minute timer. Transmit 2 seconds on 145.850 w/ 74.4 Hz to activate

d - Will transmit telemetry 0.5s after transponder activated if not reactivated

Do I Just Program Those
Frequencies into My Radio?

Do I Just Program Those
Frequencies into My Radio?

NO

If it was that easy – everyone would be doing it.

We need to account for the doppler effect

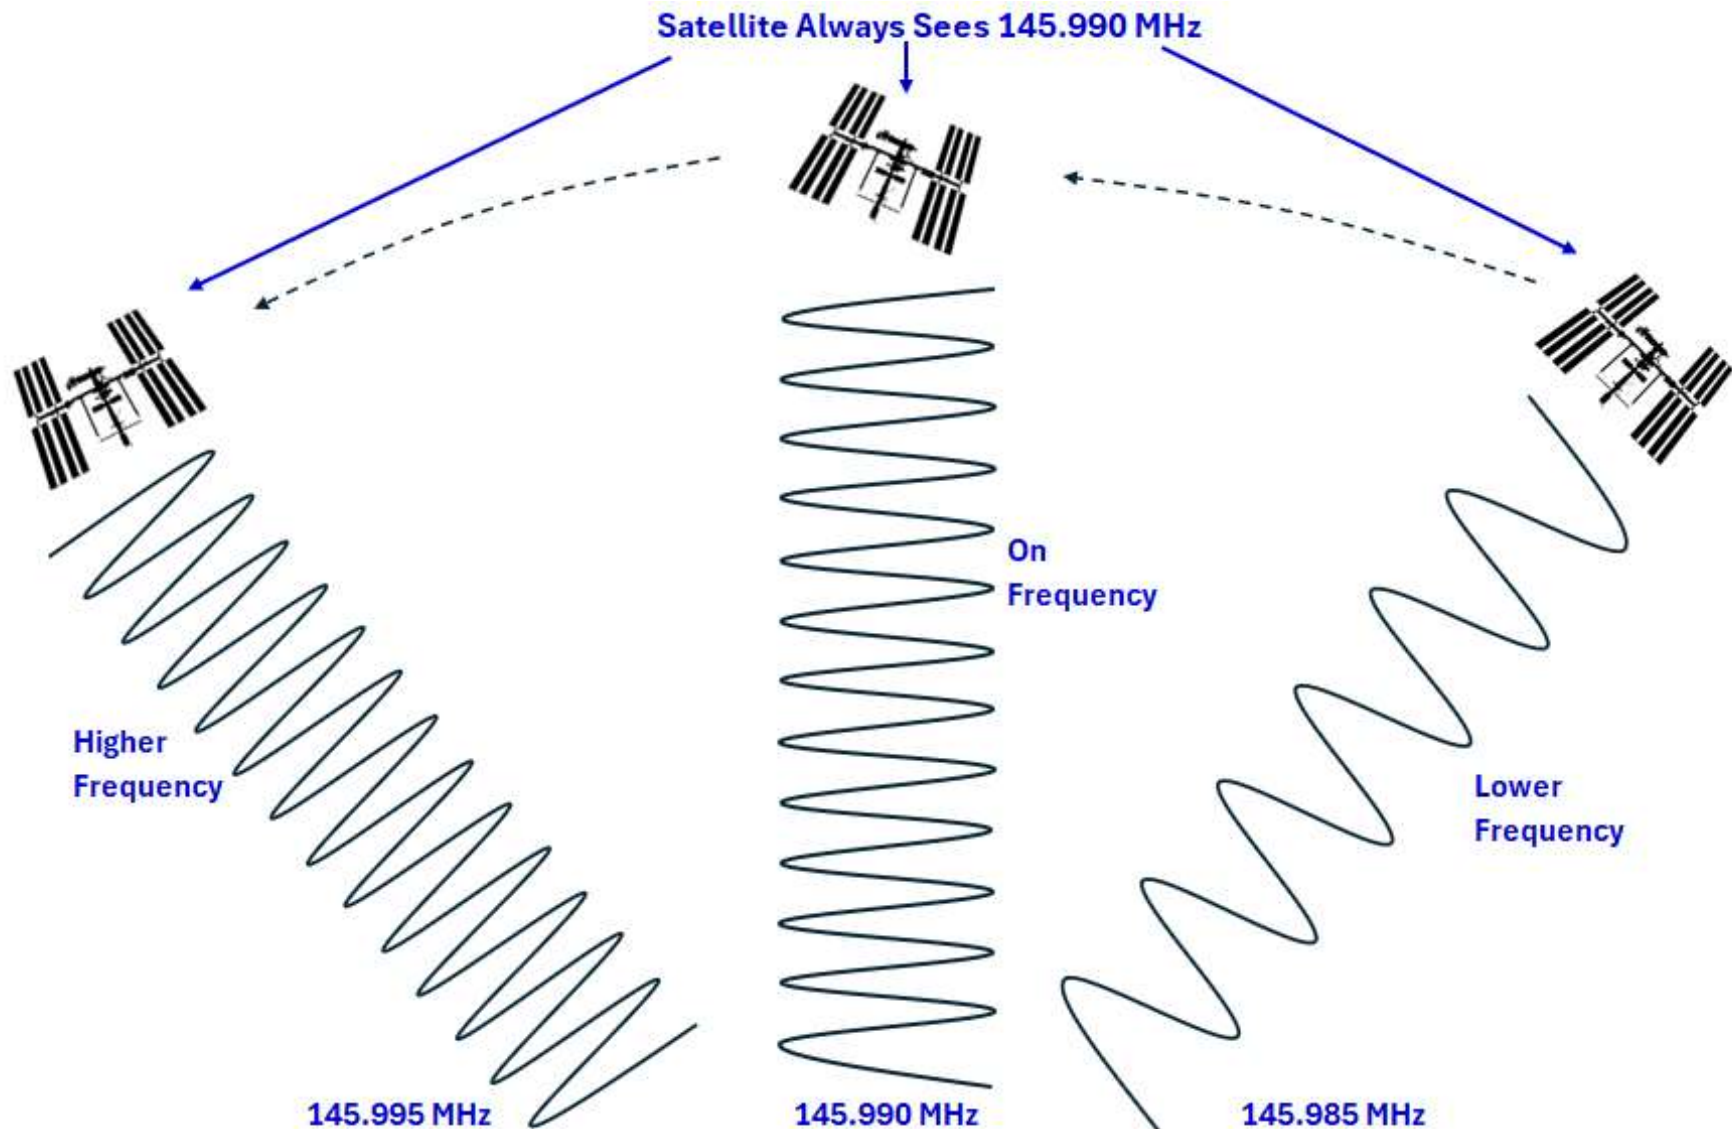

The Doppler Effect

The apparent change in the frequency of a wave caused by relative motion between the source of the wave and the observer

In our case:

The apparent change in the radio frequency caused by the motion between the RF transmitter and the RF receiver

Transmission 'to' the ARISS Transponder

<< Frequency you send starts lower and ends higher

2 Meter Band - Wavelength

Number of radio waves passing a point in 1 second? (frequency/hertz)

145.990 MHz	$\frac{\text{Speed of Light (m/s)}}{\text{Frequency (Hz)}} = \frac{299,792,458}{145,990,000} = 2.05351 \text{ Wavelength (m)}$
145.985 MHz	$\frac{\text{Speed of Light (m/s)}}{\text{Frequency (Hz)}} = \frac{299,792,458}{145,985,000} = 2.05358 \text{ Wavelength (m)}$
	0.00007 Difference

hertz (Hz) = waves per second wavelength = meters per wave

Transmission 'from' the ARISS Transponder

<< Frequency you receive starts higher and ends lower

Other Options for Doppler Adjustment

- Some radios can accept input (CAT control) from a computer that will adjust for doppler more precisely using a specific satellite program (IC-705, IC-9700, Yaesu-991a, and similar)
- The Retevis RT3S HT w/GPS (~\$100) can be programmed with OpenGD77 (free software) to adjust for doppler and display satellite location (also UV380/390, MD-9600, and others)

Search and Rescue Satellites – Doppler

SARSAT emergency beacons transmit in the 406MHz range when there is an emergency. Those signals are received by satellites and doppler is used to determine the beacon's location. www.sarsat.noaa.gov

Can I use the Stock Vertical Antenna?

- You can **listen** to the ARISS transmitting at 5 watts, but you will struggle hearing the satellites transmitting at less than 1 watt.
- Successful transmitting and receiving with these satellites is going to require some 'gain'

In a transmitting antenna, the gain describes how well the antenna converts input power into radio waves headed in a specified direction. In a receiving antenna, the gain describes how well the antenna converts radio waves arriving from a specified direction into electrical power.

Gain is usually measured in logarithmic decibel units or dBs, making "dB gain" an expression of amplification (*3 dB gain equivalent to doubling the power*)

What Antenna Should I Use?

- A Yagi antenna is the classic go-to for satellite work. Some folks opt for the Log Periodic.
- You can make your own antenna or purchase them

Polarization

Let's Review

- Know the FM satellites
- Finding / tracking the satellite
- What is footprint / possible contact distance
- Ready for doppler (programming or auto)
- Antenna with some gain on 2m/70cm

Practical Walkthrough

- Radio connected to antenna
- Power on and correct frequencies selected
- Phone app running and satellite selected (GPS & time)
- Digital recorder on – note the pass details
- 5 watts output is plenty (don't overwork sat AGC/batteries)
- Squelch off – yes, it's noisy
- Antenna up and thinking about polarization
- Listen, listen, listen... (you are sharing a 10-minute pass)
- Try an exchange – (call sign and grid square)
 - Hear: Whiskey Delta Nine Echo Whiskey Kilo, Delta Mike 43
 - Respond: Whiskey Delta Nine Echo Whiskey Kilo, this is Kilo Kilo Seven Oscar Victor Foxtrot, Charlie November 85
 - Hear: Kilo Kilo Seven Oscar Victor Foxtrot, this is Whiskey Delta Nine Echo Whiskey Kilo, QSL?
 - Respond: QSL, 73 or QSL, Thanks for the contact

What was that Exchange?

- Exchange – (call sign and grid square)
 - **Hear:** Call sign A (phonetically), grid square
 - **Respond:** Call sign A, this is my call sign (phonetically), my grid square
 - **Hear:** My call sign, this is call sign A,
QSL?
 - **Respond:** QSL 73 or QSL thanks for the contact

Maidenhead Grid Square

Grid squares are a shorthand means of describing your general location anywhere on the Earth.

The *Maidenhead Locator System* generally denotes a grid square which measures 1° latitude by 2° longitude (approximately 70×100 miles in the continental US).

A grid square is indicated by two letters (the *field*) and two numbers (the *square*)

Field, Square, Sub-square

<https://www.sotamaps.org/>

Maidenhead Locator System 1980

Schedule a Satellite Contact

- You've got a friend in Denver, Colorado (DM79) and you live in Portland, Oregon (CN85)
- Use Satmatch.com to find a common ARISS pass

Satellite(s):

How do I Log my Satellite Contacts

The ARRL's Logbook of The World (LoTW) is the go-to logging platform for satellite contacts.

- Membership in the ARRL is not a requirement. To use LoTW, download the free TQSL application and direct it to request participation.
- The ARRL will send a postcard to the address specified in your FCC license that includes an 8-digit password.
- You'll be issued a unique callsign e-certificate and provided with access to an LoTW Account via the internet.
- After you're registered, you can submit QSOs to LoTW by either using TQSL to digitally sign those QSOs and convey them to LoTW via the internet, or by using one of the many logging applications that provide this capability.

LoTW Screenshots

- Logging a satellite contact and reviewing QSOs

Send a QSL Card

- QSL is shorthand for: “I acknowledge receipt of your message or transmission.”
- The card is like a physical handshake after a contact and can be very personalized
- Requirements for Satellite QSL cards:
 - Your callsign, address, county, country, CQ zone, grid square
 - Contacts callsign, grid square
 - Satellite name, UTC date/time, uplink band or frequency, mode (FM)
 - Size 3.5” x 5.5” << highly preferred
- Provide SASE (you might get it back)

Satellite Operating Awards

ARRL

- Century Club VUCC Satellite (QSOs w/100 unique grids from a single grid)
- Worked All States (QSOs w/all US States from single grid)

AMSAT

- Satellite Communicators' Club (1st QSO)
- Oscar Satellite Communications Achievement Award (20 QSOs, unique state/prov, one satellite). Add'l awards at 60 and 100.
- South Africa Satellite Communications Achievement Award (25 QSOs on SO-50/phase 2 sats)
- AMSAT Rover Award (25 points – see rules)
- GridMaster Award (QSOs in all 488 CONUS grids)
- Reverse VUCC (VUCC/r) Award (QSOs from 100 grids)
- Robert W. Barbee Jr., W4AMI Satellite Operator Achievement Award (1,000 non-unique QSOs – no confirmation required)

ARISS.org – QSL cards for ISS contacts/activity

Other ARRL – Worked All Continents, DX Century Club

Let's Review

- Know the FM satellites
- Finding / tracking the satellite
- What is footprint / possible contact distance
- Ready for doppler (manual, programmed, auto)
- Antenna with some gain on 2m/70cm
- Get on the birds: Radio, antenna, sat app (gps & time), recorder, squelch off, listen...
- Make the exchange – callsign, grid square
- Schedule a contact / chase new grids
- Log the contact, maybe send a QSL card
- Contribute to AMSAT status page
- Apply for awards

Why Voice Satellite?

- Fun
- Home or mobile – very portable
- Technical challenge
- Scheduling in advance (no propagation worries)
- 10-minute time commitment
- Small ham community
- You could be someone's 1st satellite contact
- West Coast (less busy, WAS is possible on FM)
- Awards (with low numbers)
- The ISS is known to all

Operating Mode Abbreviations

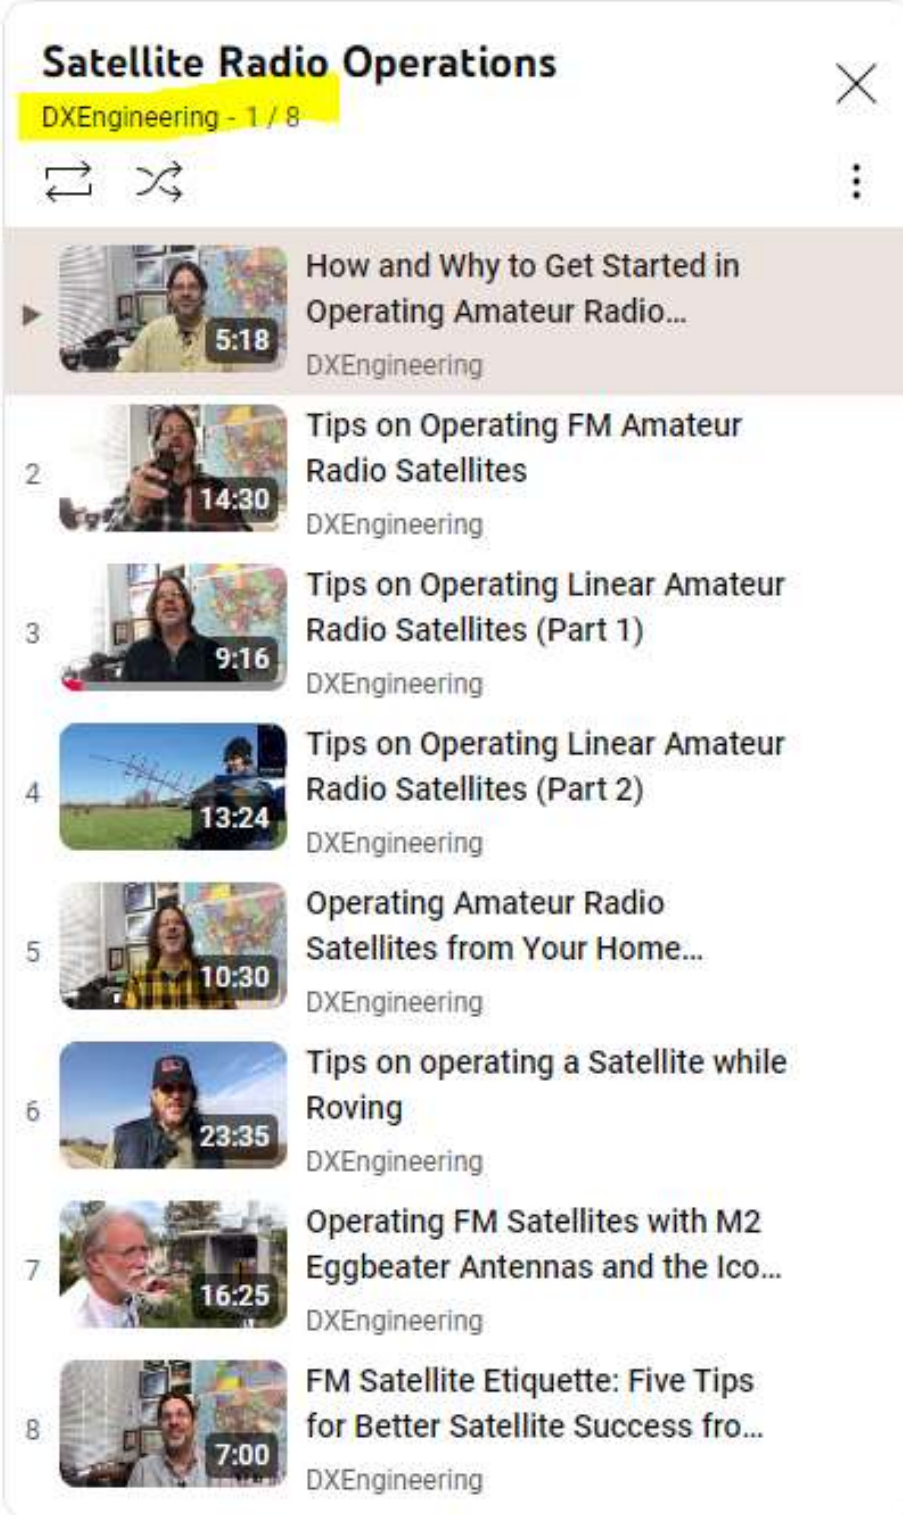

Operating Mode	Frequency Range
U/V	435-438 MHz / 144 – 146 MHz
V/U	144 – 146 MHz / 435-438 MHz
L/U	1.26 – 1.27 GHz / 435 – 438 MHz
V/H	144 – 146 MHz / 21 – 30 MHz
H/S	21 – 30 MHz / 2.40 – 2.45 GHz
L/S	1.26 – 1.27 GHz / 2.40 – 2.45 GHz
L/X	1.26 – 1.27 GHz / 10.45 GHz
C/X	5.8 GHz / 10.45 GHz

Weather Satellite Data Capture

Peter Vogel, VE7AFV Vancouver, B.C.

Peter Vogel @PeterVogel · 7h

GOES-18 at 1710 UTC / 9:10 AM PST. Full disk, not quite actual colour.
Terminator approaching Hawaii.

[@bc_news_addict](#) [#BCstormwatch](#)

... Peter Vogel @PeterVogel · Nov 15

How special. To get terrific images from each of the three active NOAA APT satellites, 18, 19, 15, along with an additional thermal image from 18. Ultracheap \$35 ground station (old Raspi, [@Nooelec](#) NESDR Nano, broken TV rabbit ears antenna here in Vancouver).

[#BCstormwatch](#)

SatDump Software

- SatDump is general purpose satellite data processing software.
- Gaining popularity as it is a ‘one-stop-shop’ that covers all the stages from satellite transmission capture, decoding, to image production.
- Supports many SDRs such as RTL-SDR, Airspy, HackRF, BladeRF, LimeSDR, PlutoSDR, etc.

Satellite Tracking & Data Transmission Capture

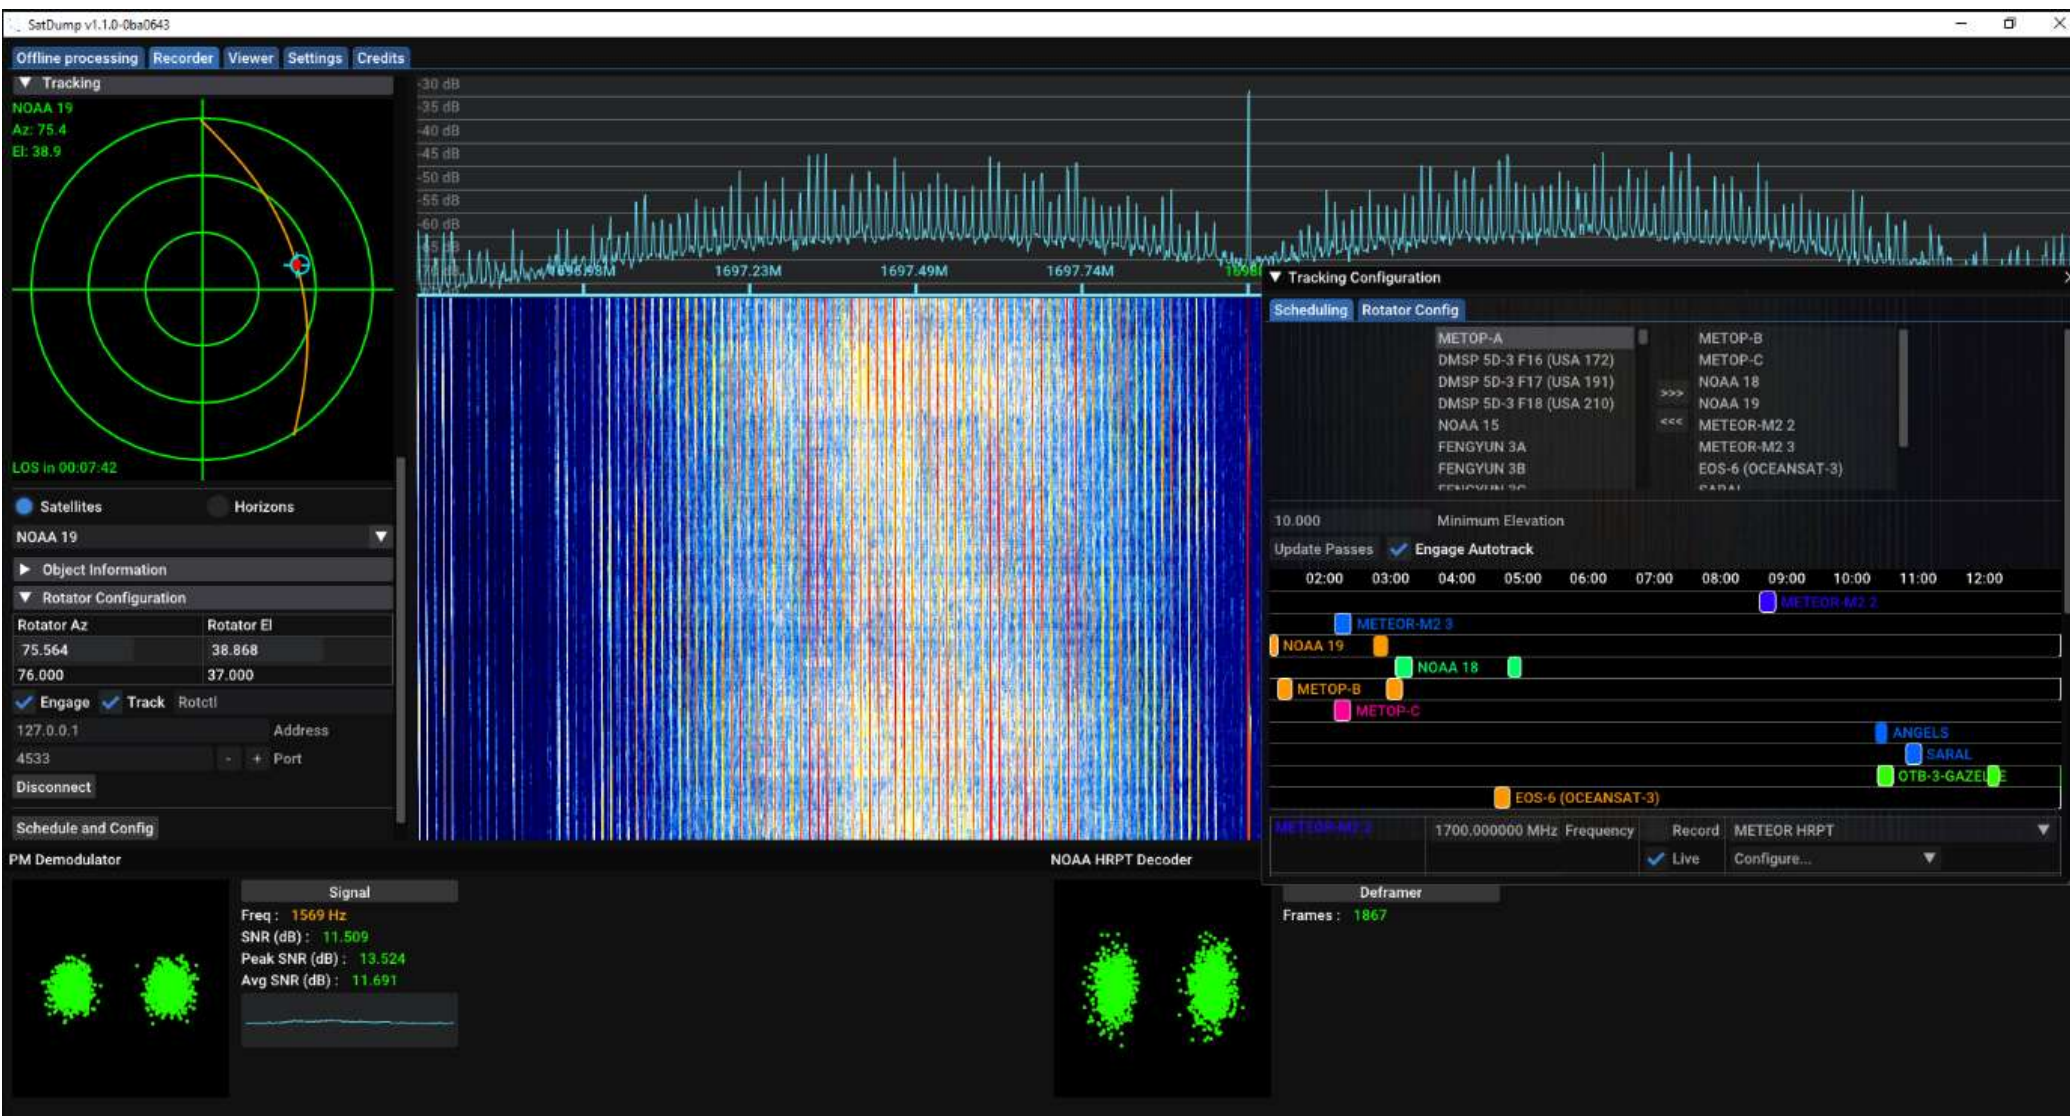

Image Processing and Overlay Map

The screenshot displays the SatDump v1.1.0-f294964 software interface. The main window features a dark theme with a menu bar at the top containing 'Offline processing', 'Recorder', 'Viewer', 'Settings', and 'Credits'. Below the menu bar, there are two tabs: 'Products' and 'Projections', with 'Projections' currently selected.

The 'Projections' panel on the left includes the following settings:

- Projection:** A dropdown menu.
- Output image:** Dimensions of 2048 x 1024.
- Stereo:** A dropdown menu.
- Center Coordinates:**
 - Lat: 36.000
 - Lon: -76.000
 - Scale: 1.000
- Buttons:** 'Generate Projection' and 'Save Projected Image'.
- Layers:** A dropdown menu.
- Mode:** 'Blend' and 'Overlay' (selected).
- Layers list:** Includes 'IASI' and 'AVHRR/3', each with a '✓' icon, a '✗' icon, and an 'Opacity' slider set to 100%.

The main display area shows a satellite image of a coastal region, overlaid with a color-coded map. The map uses a color scale from blue (low values) to red (high values), with yellow and green in between. The map is tilted and semi-transparent, allowing the underlying satellite imagery to be visible. The background of the main window is a dark map showing the outlines of continents.

Slow Scan Television (SSTV)

- SSTV is a method of sending photographic images, monochrome or color, using a voice channel and up to 3 kHz of bandwidth
- It's an analog signal that uses frequency shift modulation in which different values of brightness or color uses a different audio frequency
- There are a number of different modulation modes with different results – B&W, Color, low resolution, high resolution
- Transmission for a single picture can take eight seconds to several minutes (usually 1 or 2 min.)

What are the tools?

- Use a phone app like Robot36 (android) or SSTV Pad (ios); (SSTV Encoder for TX on android)
- Hold the phone up to the radio's speaker during the SSTV transmission, or record the transmission and play it to your phone later
- Use a computer program like MM-SSTV, RX-SSTV, (Win/Linux), or Black Cat SSTV (Win/Mac)
 - Connect to your radio with the appropriate cables / cords, or
 - You're just listening / receiving so an SDR is great

Watch for an SSTV Event

- Satellite broadcast of SSTV images is usually a scheduled event and is publicized
- ISS – November 2024 transmitted 12 images featuring activities from the 2024 40th Anniversary Celebrating Amateur Radio in Human Spaceflight (@ARISS_Intl on X)
- Sonate-2 transmits images of earth taken from orbit monthly/frequently (@JMUSpace on X)

Peter Vogel's SDR Approach

SDR, AirSpy, Orbitron, RX-SSTV

The screenshot displays a complex software-defined radio (SDR) environment. The primary window, AIRSPY SDR Studio, is configured for a frequency of 145.870.922 MHz. It features several panels: Radio (with filters like Blackman-Harris 4 and bandwidth settings), Display (theme and resolution), Audio (sample rate and output), Meteor Demodulator (modulation type and tracking options), and Tracking (scheduler and active satellite info). A Scheduler window is prominently displayed, listing satellites such as BGSARPI1 and providing a list of available commands for radio control. A large spectrum plot on the right side shows the 2m Ham Band with a red vertical line indicating the current frequency. In the bottom left corner, the RX-SSTV v.2.2.0 window shows a satellite image and RX options. A terminal window in the bottom center displays real-time telemetry data for a satellite, including sequence number, voltage, and position. On the bottom right, the Orbitron 3.71 window provides a world map with satellite tracks and a data table for BGSARPI1, showing details like Azimuth, Drift/MHz, and Receive/Doppler.

Azimuth	Drift/MHz	Receive/doppler	Drift/mode	Driver
353.0	145.870000	145.870922	FM-w	SDRSharp

Sonate-2:

APRS

- APRS stands for Automatic Packet Reporting System, a system that allows amateur radio operators to transmit information such as GPS location along with a message
- When an APRS packet is sent (usually on 144.390 MHz) it can be received by another APRS capable radio or a receiver acting as an i-Gate connected to the internet
- APRS has numerous use cases and operates world-wide – see APRS.org to learn more
- For satellite, we are going to focus on the basic functionality of sending a GPS location and a message and use 145.825 MHz

APRS for Non-APRS Radios

- Use 'UISS' software (will also include 'Sound Modem' software) qsl.net/on6mu/uiss.htm
- You will need a digital link to your radio – if you are set up for Winlink email or FT8 – you have what you need for APRS via UISS software
- Start up Sound Modem first (select com ports to your radio)
- Then start up UISS and tune your radio to 145.825 MHz (consider doppler)

https://www.amsat.org/wordpress/wp-content/uploads/2014/01/AMSAT_Journal_ISS_Packet.pdf

UISS Interface for the ISS

Enter your call sign, address 'CQ' to the ISS 'RS0ISS'. Prepopulate your messages. When the satellite is overhead and active use the buttons to send your location and messages.

Did Your APRS to ISS Hit an i-Gate

- Check out ariss.net

A satellite with two large solar panels is shown in orbit above the Earth's horizon. The satellite is a small, dark, cylindrical object with several thin antennas extending from its top. The Earth's surface is visible below, showing a mix of blue oceans and white clouds, with a thin layer of atmosphere at the horizon. The background is a deep blue space with a few distant stars.
